

Anesthesia for Pregnancy & C - Section

Erin Wendt-Hornickle, DVM, DACVAA
ewendtho@umn.edu

AMERICAN COLLEGE OF
VETERINARY ANESTHESIA
AND ANALGESIA

Big picture

- ▶ Physiologic changes that impact anesthesia
- ▶ Anesthetic drugs and suggested techniques
- ▶ Safe anesthetic practices and successful outcomes

Changes in Pregnancy

- ▶ Physiologic changes
 - ▶ CV
 - ▶ Pulmonary
 - ▶ CNS
 - ▶ GI

Maternal Physiology - Cardiovascular

- ▶ Physiologic changes optimize nutrient delivery to fetus
 - ▶ Inc HR (55%)
 - ▶ Inc SV
 - ▶ $HR \times SV = CO$
 - ▶ Inc CO (30-40%)
 - ▶ Uterine BF increases by 20-40x
 - ▶ CO needs to meet demand!

Maternal Physiology - Cardiovascular

- ▶ Decreased blood pressure (10%)
 - ▶ $MAP = CO \times SVR$
 - ▶ Vasodilation = decreased SVR
 - ▶ Progesterone, nitric oxide, prostaglandins

Maternal Blood Changes

- ▶ Increased circulating volume (25-35%)
 - ▶ Increased aldosterone = **vasodilation**
 - ▶ Increase in volume > increase in blood components
→ dilutional **anemia**
 - ▶ Decreased albumin
 - ▶ Increase in total body water
- ▶ Normal O₂ delivery
- ▶ Electrolytes unchanged

Maternal Supine Hypotension

- ▶ Compression of aorta, vena cava
- ▶ Concern in small animals?
 - ▶ Not evident in hemodynamically normal small-medium sized dogs
- ▶ Elevate right hip

Maternal Physiology- Pulmonary

- ▶ Decreased FRC (20%)
 - ▶ Uterus impinging diaphragm
- ▶ Mild decrease in total lung capacity (5%)
- ▶ Increased RR & TV
 - ▶ Increased minute ventilation (70%)
- ▶ Chronic respiratory alkalosis
 - ▶ $\text{PaCO}_2 \sim 30 \text{ mmHg}$
- ▶ Increased oxygen consumption (VO_2)

Maternal Physiology- Gastrointestinal

- ▶ Increased risk of reflux & aspiration
 - ▶ Prolonged gastric emptying, SI transit time
 - ▶ Decreased esophageal sphincter tone
 - ▶ Increased intra-abdominal/intra-gastric pressure
 - ▶ Increased gastrin production → acidity
- ▶ Hepatic function tests increased

Maternal Physiology-Renal

- ▶ Increased blood flow (80%)
- ▶ Increased GFR (50%)
 - ▶ Decreased BUN, creatinine
- ▶ Increased bicarbonate excretion
 - ▶ Compensatory metabolic acidosis
- ▶ Post-partum diuresis
 - ▶ Plasma volume normal

Maternal Physiology - CNS

- ▶ Decrease in MAC (16-40%)
- ▶ Reduced volume of epidural space
 - ▶ Increased size of epidural veins
- ▶ Decrease volume of CSF
- ▶ Increased sensitivity to local anesthetics

Pharmacology and pregnancy

- ▶ Few controlled studies exist
- ▶ Extrapolated from human, rodent data

Anesthetic drugs and the placenta

- ▶ Lipid soluble
- ▶ Size/Molecular weight (<600 Da)
- ▶ Non-ionized
- ▶ Non-protein bound
- ▶ Diffusion gradients to fetus
- ▶ Most anesthetic drugs
 - ▶ <300Da, highly lipid soluble

Fetal ion trapping

- ▶ Non-ionized drugs cross placenta
- ▶ Fetal blood more acidic
- ▶ Drug $pK = pH$
- ▶ Weak bases (opioids, *systemic* LA, ketamine) become ionized
- ▶ Cannot cross back into mother for elimination

Ion trapping

Anesthetic goals

- ▶ Maintain oral reflexes
 - ▶ Rapid intubation
- ▶ Maintain uterine blood flow
 - ▶ NO autoregulation
- ▶ Maintain PaO₂
- ▶ Minimize fetal concentrations of drugs that cause respiratory, cardiovascular and CNS depressant effects

Anesthetic agents and pregnancy - Anticholinergics

- ▶ Atropine
 - ▶ Placental transfer
 - ▶ Tachycardia
 - ▶ Use with opioids to avoid fetal bradycardia
- ▶ Glycopyrrolate
 - ▶ NO placental transfer
 - ▶ Large molecular weight

Anesthetic agents and pregnancy - Acepromazine

- ▶ Slow placental transfer
- ▶ HYPotension could decrease UBF
- ▶ Study in cattle failed to demonstrate
- ▶ Not associated with increase in maternal or neonatal mortality
- ▶ Long lasting, no antagonist
- ▶ LOW doses

Anesthetic agents and pregnancy - Benzodiazepines

- ▶ Diazepam, midazolam, zolazepam
 - ▶ Placental transfer
 - ▶ Potential for teratogenesis
 - ▶ Increased risk of cleft palate in 1st trimester
 - ▶ 'floppy infant syndrome' near term
 - ▶ Minimal cardiovascular depression
- ▶ Nice in LOW doses
 - ▶ Antagonist available

Anesthetic agents and pregnancy - Alpha-2 agonists

- ▶ Xylazine / detomidine / dexmedetomidine, etc
 - ▶ Rapid placental transfer
 - ▶ Significantly decreased UBF
 - ▶ Increased intrauterine pressure
 - ▶ Increased uterine motility
 - ▶ Decreased CO
 - ▶ Potentially decreased PaO₂
 - ▶ Increased likelihood of survival in c-section pups when xylazine NOT used
 - ▶ Etc, etc, etc.....
- ▶ NOT recommended
 - ▶ Use with caution in mares during pregnancy
 - ▶ Informed consent!!

Anesthetic agents and pregnancy - Opioids

- ▶ Placental transfer
- ▶ Fetal depression
 - ▶ Dose dependent, more significant in newborn
- ▶ Nice in LOW doses
 - ▶ Antagonist available

Anesthetic agents and pregnancy - Opioids

- ▶ Systemic opioids
 - ▶ Fentanyl readily crosses placenta
 - ▶ Persists in fetus long after clearing maternal circulation
 - ▶ Morphine slower to cross placenta
 - ▶ Hydromorphone = intermediate speed
 - ▶ Buprenorphine: only 10% reaches fetus
 - ▶ BUT NOT EASILY ANTAGONIZED

Anesthetic agents and pregnancy - Ketamine

- ▶ Associated with decreased puppy vigor
- ▶ Neurotoxicity in 2nd trimester in rats
- ▶ Higher neonatal mortality and neurologic depression in puppies
- ▶ Increased uterine tone, contractions in early human pregnancies
- ▶ No antagonist
- ▶ Not recommended in SA

Anesthetic agents and pregnancy – Propofol, Alfaxalone

- ▶ Short acting, rapid distribution
- ▶ Maternal hypotension
- ▶ May dilate placental vessels
- ▶ Higher APGAR scores with Alfaxalone
- ▶ Safe choices

Anesthetic agents and pregnancy - Inhalants

- ▶ Decreased MAC in parturients (16-40%)
- ▶ Minimally metabolized
- ▶ Rapidly cleared by neonate
 - ▶ If breathing!
- ▶ Isoflurane, sevoflurane, desflurane all considered safe choices

Anesthetic agents and pregnancy - Blood pressure support

- ▶ Ephedrine
 - ▶ Increases BP without decreasing UBF in ewes
- ▶ Dopamine, Dobutamine
 - ▶ Increase BP, decrease UBF
 - ▶ Dose dependent
 - ▶ Dopamine > dobutamine

Anesthetic agents and pregnancy - Muscle Relaxants

- ▶ GG
 - ▶ Placental transfer
 - ▶ Little effect on foal
- ▶ NMBD
 - ▶ Little to no placental transfer
 - ▶ Not necessary

Considerations for pregnant patients

- ▶ High regurgitation risk
 - ▶ Avoid excessive sedation
 - ▶ Rapidly secure airway
 - ▶ Suction
 - ▶ PPI, prokinetic, H2 antagonist?
- ▶ Avoid preterm labor
 - ▶ Avoid stress/catecholamine release
 - ▶ Avoid alpha 2 agonists
 - ▶ Delay if elective

Considerations for pregnant patients

- ▶ Avoid fetal asphyxia
 - ▶ Maintain maternal PaO₂
 - ▶ Pre, post-oxygenate – ALWAYS!
 - ▶ Avoid apnea, atelectasis
 - ▶ Maintain maternal PaCO₂
 - ▶ Use capnography
 - ▶ Assist ventilation
 - ▶ Maintain uterine blood flow
 - ▶ MAP > 70 mmHg

Suggested techniques

- ▶ Dog/Cat
 - ▶ Alfaxalone/propofol induction + inhalant + epidural
 - ▶ maternal opioid after puppies delivered
 - ▶ Opioid/propofol/alfaxalone induction + inhalant + line block
 - ▶ prepared to reverse opioid in puppies
 - ▶ Naloxone
 - ▶ Sublingually
 - ▶ 1 drop of 0.4 mg/mL OR
 - ▶ 1mL/min of 0.04 mg/mL IV
 - ▶ One dose post-op NSAIDs
 - ▶ Avoid ketamine/midazolam, thiopental
 - ▶ Luna 2004, Moon 2002

Suggested techniques

- ▶ Local anesthesia

- ▶ Line block

- ▶ SC infiltration 1 mg/kg 0.5% bupivacaine OR
 - ▶ 2-4 mg/kg 2% lidocaine
 - ▶ Questionable efficacy

- ▶ Epidural

- ▶ Least neurological or respiratory depression of puppies (Luna 2004)
 - ▶ Dose adjustments for LA!

Suggested techniques

- ▶ Horse

- ▶ GG/ketamine induction + inhalant + one dose post-op NSAIDs

- ▶ Maternal opioid after delivery of foal

- ▶ Ketamine/propofol induction + inhalant + one dose post-op NSAIDs

- ▶ Maternal opioid after delivery of foal

- ▶ TIME!!

Suggested techniques

- ▶ Cow
 - ▶ Epidural or paravertebral regional anesthesia
- ▶ Swine
 - ▶ Epidural
 - ▶ xylazine/ketamine + inhalant

Neonatal resuscitation

▶ PREPARATION!

- ▶ Bodies
- ▶ Warm towels
- ▶ Pre-warmed incubator
- ▶ ETT, laryngoscopes, airway masks, catheters
- ▶ Oxygen
- ▶ Emergency drugs, pre-calculate dosages
- ▶ Checklists!
- ▶ Video

Neonatal Resuscitation = ABCD's

- ▶ Airway
- ▶ Breathing

- ▶ Cardiac/circulation
- ▶ Drugs

Neonatal Resuscitation = ABCD's

- ▶ Airway
 - ▶ Suction bulb
 - ▶ Intubate/mask
- ▶ Breathing
 - ▶ Supply tactile stimulation
 - ▶ Perineal, abdominal areas
 - ▶ Doxapram
 - ▶ 1 drop

Neonatal Resuscitation = ABCD's

- ▶ Cardiac/circulation
 - ▶ Check heart rate
 - ▶ OXYGEN!
 - ▶ Epinephrine 0.1 mcg/kg
- ▶ Drugs
 - ▶ Reversal agents
 - ▶ Naloxone
 - ▶ Flumazenil

Neonatal Resuscitation

- ▶ Umbilical cord
 - ▶ ligate
- ▶ WARMTH

Neonatal Resuscitation

- ▶ Congenital abnormalities
 - ▶ cleft palate
 - ▶ limb deformities
 - ▶ spinal deformities

Recovery of Mom

- ▶ Do not continue narcotics
 - ▶ use locals for analgesia
- ▶ Alert
 - ▶ avoid harm to the babies
- ▶ Clean mammary area
- ▶ Discharge ASAP

Summary

- ▶ Physiologic changes that impact anesthesia
- ▶ Anesthetic drugs and suggested techniques
- ▶ Safe anesthetic practices and successful outcomes
