## Combinations

Ti. University of Minnesota

## Preliminaries and Objectives

Preliminaries

- General Counting Principle
- Permutations
- Factorial Notation

Objectives

- Count the number of ways to select $k$ objects from a set of size $n$

## Permutations

The number of ways to place $k$ objects in order from a set of size $n$ is

$$
P(n, k)=\underbrace{(n)(n-1)(n-2) \ldots(n-k+1)}_{k \text { terms multiplied }}=\frac{n!}{(n-k)!}
$$

## Permutation Example

From a collection of five colored marbles, in how many ways, can you place three marbles in order?

$$
5 \times 4=30=\frac{5!}{(5-3)!}
$$

What if we only care about the colors and not the order?

## Combinations

From a collection of five colored marbles, in how many ways, can you place three marbles in order?

For each combination of three colors, there are 3! permutations of that one combination.

## Combinations

In general, for each combination of $k$ objects, there are $k$ ! permutations of that one combination.

Therefore,

$$
P(n, k)=k!\cdot C(n, k)
$$

and

$$
C(n, k)=\frac{P(n, k)}{k!}=\frac{n!}{k!(n-k)!}
$$

where $C(n, k)$ denotes the number of combinations of $k$ objects picked from a set of size $n$,

## Other Notations

$$
C(n, k)={ }_{n} C_{k}=\binom{n}{k}
$$

## Connection to Pascal's Triangle

$\binom{n}{k}$ is the $k^{\text {th }}$ entry in row $n$ of Pascal's Triangle, where the $n^{\text {th }}$ row begins

$$
1 \quad n \quad \ldots
$$

and the index $k$ begins at zero, so the $0^{\text {th }}$ term of row $n$ is 1 , the first term is $n$ etc.

## Connection to Pascal's Triangle - Example

How many ways are there to select a combination of three marbles from a set of five?

## Connection to Pascal's Triangle - Example

The number of ways to select a combination of three marbles from a set of five is 10 .

$$
0^{8} \therefore^{8}
$$

## Combinations and Pascal's Triangle

The recursion for Pascal's Triangle is

$$
\binom{n-1}{k-1}+\binom{n-1}{k}=\binom{n}{k}
$$

This also works for combinations as in this example:
How many combinations of 3 marbles can be made from a set of 5 marbles?

How many combinations of 3 marbles can be made from a set of 5 marbles that contain the blue marble? ${ }_{4} C_{2}=6$ How many combinations of 3 marbles can be made from a set of 5 marbles that don't contain the blue marble $?_{4} C_{3}=4$
